

ABSTRACT

The present invention provides a communications terminal in which feelings which arise spontaneously can be actively
5 communicated to a partner. Communications terminals (30a) and (30b) communicate with a partner terminal via a transmission line (90), and include: an input unit (31), which receives a finger operation including tapping; a packet generating unit (32), which generates a packet which is data describing an action that is a
10 motion to be executed by a partner terminal, based on the received operation; a transmission unit (33), which sends the generated packet to the partner terminal; a receiving unit (11), which receives the sent packet; and an action executing unit (22), which executes an action described in the received packet.
